

Insufficient Logging & Monitoring

<1 min

Insufficient Logging and Monitoring occurs when the logging and monitoring systems in place are insufficient for security purposes. This can make it difficult to detect security breaches, respond to them, and investigate and prosecute them.

From a programming perspective, programs must have robust, configurable logging capabilities, especially if running in an organizational environment rather than as a personal project. Robust logging helps troubleshoot technical issues and provides additional data that the security team can use to protect the environment.
